

RCS + VRF Subnet --- Pipeline Architecture (v7)

LEG 2 driven by PoW difficulty mechanism; LEG 5 timing via hash-graph (LEG 7)

Updates from v4: parameters in LEG 2 set by PoW difficulty mechanism (adjusted based on observed network behavior);

LEG 5 timing now measured via hash-graph propagation (LEG 7), not wall-clock; H1SHAKE256 question still open;

v7 adds the target-properties panel (colton's four requirements) mapped to legs
